

SmileLine

SmileLine, product number DM-9, transforms a critical clinical concept into a simple, powerful planning solution. Inspired by proven prosthodontic techniques, SmileLine accurately captures and transfers a patient's maximum smile line into CBCT imaging, giving clinicians a clear, visual reference for ideal bone reduction and implant placement. By eliminating guesswork, SmileLine helps ensure the prosthesis-tissue junction stays hidden during a full smile, reducing esthetic risk while improving surgical precision, efficiency, and confidence. It's a smarter, more predictable way to plan implant restorations
