ORTHOVEST EXOSKELETON SUPPORT SYSTEM

RA-ORTHOVST-S | RA-ORTHOVST-M | RA-ORTHOVST-L

The Orthovest Exoskeleton Support System is an ergonomic lead apron support system designed to reduce strain on the neck, shoulders, and back. It redistributes the weight of heavy radiation protection aprons to the hips, helping reduce physical stress during long procedures. This makes it a practical solution for healthcare professionals who regularly wear lead aprons.

Featuring a rigid, lightweight structure, this support system helps transfer apron weight away from the spine. Its adjustable waist belt provides a secure fit, while the shoulder supports help distribute the load to the hips. In addition, the design allows users to bend, reach, and move comfortably throughout their workday.

Designed for use underneath an existing lead apron, the OrthoVest requires no changes to current radiation protection garments. Simply put on the support system, adjust the waist belt, and wear your lead apron over it. This convenient design makes it suitable for professionals who spend extended periods wearing lead aprons.

Available in three sizes, from Small to Large, the OrthoVest accommodates different torso lengths. Choosing the correct size helps ensure proper weight distribution and a comfortable fit.

By reducing the load on the upper body, this ergonomic support system helps improve comfort during prolonged lead apron use. It is an ideal accessory for healthcare professionals seeking additional support without replacing their existing radiation protection equipment.

SPECIFICATIONS
